Abstract

Historically, many authors of regional accounts of the Leguminosae (Fabaceae) tribe Cercideae divided the caesalpinioid genus *Bauhinia* *sens. lat.* into several segregate genera including the genus *Phanera*. However, during the last fifty years, *Bauhinia* has more often been recognised as a broadly circumscribed taxon with *Phanera* reduced to a subgenus of *Bauhinia* *sens. lat.* The reinstatement of *Phanera* at generic rank based on molecular and morphological evidence has now been widely accepted, resulting in the need for new combinations in *Phanera* for many taxa described in *Bauhinia*. Some of those names have been published recently by other authors so here we make the necessary combinations for those taxa still lacking names in *Phanera*. In addition, we include all published *Phanera* binomials and trinomials here and to each assign a status of accepted name, synonym or excluded name. The recent reinstatement of the New World genus *Schnella* to which c. 40 *Phanera* species were moved transforms *Phanera* into a strictly Asian and Australasian taxon. *Phanera* can be distinguished from *Bauhinia* *sens. str.* and from *Schnella* by a combination of morphological characters, but the morphological boundary with another closely related Asiatic genus, *Lasiobema* is unclear and warrants further investigation. We present a table comparing morphological characters of *Phanera*, *Schnella*, *Lasiobema* and *Bauhinia* *sens. str.*

Introduction

Leguminosae is the third largest of the angiosperm families, numbering c. 19,500 species (LPWG 2013). Three subfamilies are traditionally recognised. The smallest is Caesalpinoideae comprising c. 2300 species in 171 genera arranged in 4 tribes. One of those tribes, Cercideae, accommodates two subtribes, Cercidinae and Bauhiniinae as recognised by Wunderlin (1979) and Wunderlin *et al.* (1981). Subtribe Cercidinae comprises three genera, namely *Cercis* L., *Adenolobus* (Harv. ex Benth. & Hook.f.) Torre. & Hillc. and *Griffonia* Baill., whilst the number of genera recognized in subtribe Bauhiniinae has varied from as many as 26 genera (Wunderlin 1976) to a single genus *Bauhinia* *sens. lat.* (Wunderlin *et al.* 1981). Since 1981, the majority of authors of regional taxonomic accounts have upheld the concept of a broadly circumscribed heterogeneous *Bauhinia* *sens. lat.* (Larsen *et al.* 1980, 1984, 1996, Li *et al.* 2010). Phylogenetic analyses of nucleotide sequence data have provided convincing evidence that *Bauhinia* *sens. lat.* is not a natural taxon (Bruneau *et al.* 2001 & 2008, Hao *et al.* 2003, Sinou *et al.* 2009) and the proposal by Lewis & Forest (2005) to recognise eight generic segregates, namely *Bauhinia* *sens. str.*, *Barkyla* F.Muell., *Brenierea* Humbert, *Gigasiphon* Drake, *Lasiobema* (Korth.) Miq., *Lysiphyllum* (Benth.) de Wit, *Phanera* Lour., *Piliostigma* Hochst. and *Tylosema* (Schweinf.) Torre & Hillc. was largely supported by the findings of Sinou *et al.* (2009) in the most broadly sampled published phylogenetic study of tribe Cercideae to date. Additional molecular-based evidence comes from a study of the *rp12* intron which is present in chloroplast DNA of most angiosperms including *Phanera* but absent from *Bauhinia* *sens. str.* (Lai *et al.* 1997). Non-molecular characters that distinguish *Phanera* from *Bauhinia* *sens. str.* include habit, morphology (de Wit 1956), pollen morphology (Larsen 1975), flavonoid data (Salatino *et al.* 1999) and volatile oil data (Duarte-Almeida *et al.* 2004).

Phanera Lour.: taxonomic rank, generic limits and relationships

In 1790, Loureiro described *Phanera* to accommodate a single species, *Phanera coccinea* Lour. The most detailed regional revision of the genus ever written was published by de Wit (1956) who enumerated 44 species in Malaysia, the centre of species diversity for the genus. There has never been a monograph of *Phanera*, but Lewis and Forest (2005) estimated the genus to comprise 120–130 species, since reduced to 80–90 species following the transfer of c. 40 species to the New World genus *Schnella* (Wunderlin 2010). For much of the last thirty years the botanical taxonomic community has commonly treated *Phanera* as one of four subgenera within a broadly circumscribed *Bauhinia* sens. lat. (Bortoluzzi *et al.* 2006, Chen 1988, Larsen *et al.* 1980 & 1984, Wunderlin *et al.* 1981, Wunderlin & Eilers 2009) although other authors continued to maintain *Phanera* as a distinct genus (Verdcourt 1979) and to provide new combinations for species previously placed in *Bauhinia* (de Queiroz 2006). Wunderlin *et al.* (1976) recognised the heterogeneity within *Bauhinia* subgenus *Phanera* by proposing the subgenus be divided into 11 sections, three of which, sects. *Lasiobema*, *Lysiphyllum* and *Tylosema* were treated as distinct genera by Lewis and Forest (2005). They also suggested that *Phanera* sect. *Schnella* might need to be reinstated as a distinct genus based on a preliminary phylogenetic analysis of Cercideae by Forest (unpublished data). That view was supported by published phylogenetic analyses (Hao *et al.* 2003, Sinou *et al.* 2009). Subsequently, Wunderlin (2010) reinstated *Schnella* at generic rank to which he added the species of *Phanera* sect. *Caulotretus* as a second generic section of *Schnella*. This reclassification came only months after Vaz (2010) had transferred the majority of the same species from *Bauhinia* sens. lat. to *Phanera*. However, the decision to combine these two former *Phanera* sections in the single genus *Schnella* by Wunderlin (2010) may have been premature because a recent phylogenetic analysis of subtribe Bauhiniinae based on chloroplast and nuclear regions did not resolve species sampled from the two sections as a monophyletic group (Li *et al.*, unpublished data). Nevertheless, as a consequence of the recent reinstatement of *Schnella* into which c. 40 New World species have been transferred, *Phanera* is now a strictly Asian and Australasian taxon.

Closely associated with *Phanera* is the Asiatic genus *Lasiobema* as indicated, albeit with weak support, by Sinou *et al.* (2009). Their close relationship had previously been demonstrated by Hao *et al.* (2003) in a phylogenetic investigation of *Phanera* based on Internal Transcribed Spacer data which included 23 species of *Phanera* and four of *Lasiobema*. Those 27 species were resolved together in a strongly supported clade. Within that clade, neither genus was resolved as monophyletic but support was very low so it would be premature to draw any firm conclusions other than *Lasiobema* and *Phanera* are closely related. The relationship of *Lasiobema* with *Phanera* requires further molecular and morphological studies and, in consequence, here we do not include *Lasiobema* within *Phanera*.

The phylogenetic study of Hao *et al.* (2003) included five (of the nine) species of *Phanera* section *Corymbosae*. They were resolved together, strongly supported as a monophyletic group on a lineage placed also with strong support, as sister to the remaining *Phanera* and *Lasiobema* species samples. Section *Corymbosae* species form a morphologically homogenous group, with a distinct pollen type (Larsen 1975, Banks unpublished data), and have a generally more northerly geographical distribution than the rest of *Phanera*. Section *Corymbosae* has a centre of species diversity in S. China compared with Borneo for the remaining *Phanera* taxa. We consider this evidence sufficient to justify recognising the species of *Phanera* section *Corymbosae* as a distinct segregate genus for we propose a new name in a separate paper (Mackinder *et al.* unpublished data).

To summarise, we recognise *Phanera* here as a genus of 82 species as circumscribed by Lewis & Forest (2005) but excluding the following three groups of species: (i) sect. *Schnella* recently reinstated at generic rank by Wunderlin (2010); (ii) sect. *Caulotretus*, placed in synonymy under *Schnella* also by Wunderlin (2010) and (iii) section *Corymbosae* de Wit 1956), to be described as a new genus (Mackinder *et al.* unpublished data). A table comparing details of habit, morphology and geographical distribution of *Phanera* (as recognised here) with *Schnella*, *Lasiobema* and *Bauhinia* sens. str. is presented (Table 1).

How the list of names was assembled

A list of *Phanera* binomials and trinomials was assembled from multiple sources, initially those in electronic form including IPNI (International Plant Names Index: <http://www.ipni.org/>), Tropicos (<http://www.tropicos.org/>), TPL (The Plant List: <http://www.theplantlist.org/>) and ILDIS (International Legume Database and Information Service: <http://www.legumes-online.net/ildis/aweb/database.htm>). Additionally, we consulted major regional treatments such as “A revision of Malaysian Bauhinieae” (de Wit 1956) and the accounts of *Bauhinia* sens. lat. in

Flore du Cambodge, du Laos et du Viêtnam (Larsen *et al.* 1980); Flora of Thailand (Larsen *et al.* 1984); Flora Malesiana (Larsen & Larsen 1996) and Flora of China (Li *et al.* 2010) as well as papers describing new taxa or publishing new combinations (Thothathri 1965, Schmitz 1977, Vaz 2010, Wunderlin 2011, Bandyopadhyay *et al.* 2012). Consequently, the taxa presented here are based principally on the taxonomy of regional flora treatments. On the few occasions that we encountered conflicting taxonomic views among the treatments, we opted to uphold the most recent taxonomic placement and have noted this under the relevant accepted name in the synopsis of species that follows.

TABLE 1. A comparison of morphology, distribution and species diversity between *Bauhinia* *sens. str.* and three generic segregates including *Phanera*.

	<i>Bauhinia</i> <i>sens. str.</i>	<i>Phanera</i>	<i>Schnella</i>	<i>Lasiobema</i>
Habit	trees or shrubs	tendrilled climbers	tendrilled climbers	tendrilled climbers
Calyx	spatheaceous	lobed	lobed or truncate	lobed or truncate
Fertile stamens	1-10	3 (2)	10	3
Distribution	Pantropical	Asia and Australasia	Neotropical	Asia
No. of species	c. 150	82	c. 40	c. 15

We aim to account for all published *Phanera* names in this checklist. We have also identified nineteen taxa which belong in *Phanera* but until now have lacked published names in that genus. We provide the new combinations here. Previously published *Phanera* names that relate to taxa no longer referred to the genus are listed under excluded names. Regrettably we have discovered very little about a handful of *Phanera* names which are listed at the end of the account as doubtful or poorly known.

The majority of the checklist comprises *Phanera* accepted names listed alphabetically, with infraspecific taxa also listed alphabetically, except for the typical taxon which is listed first. Basionyms are included where relevant and types are cited for basionyms of new combinations as required by the International Code of Botanical Nomenclature.

Country Distributions

Distributions by country were initially taken from ILDIS, subsequently confirmed using literature sources (major Floras as listed above and from recently published new species papers). Additional previously unpublished country records, based on herbarium specimens lodged at K were added to the distribution (voucher details are cited directly after the relevant country). The native distributions for species which have infraspecific taxa are reported for the lowest individual taxonomic rank and also collectively for the whole species.

Doubtful or poorly known names

Here we list *Phanera* names which are not validly published or whose application is uncertain.

Phanera cordifolia Miq., *Fl. Ned. Ind.* 1(1): 66. 1855. = *Bauhinia cordifolia* Roxb. *Fl. Ind., ed. 2:* 332. 1824. Type unknown. According to Hou *et al.* (1996), these names apply to a taxon described from the Molucca Is. and the specific epithet alludes to leaf shape and venation. *Phanera cordifolia* Miq. belongs to *P. finlaysoniana* but cannot be placed in one of the varieties with any certainty.

Phanera dasycarpa Miq., *Fl. Ind. Bat.* 1(1): 1078. 1858. The name refers to a single fruiting collection made by Teijsmann in Sumatra which De Wit (1956) referred (in synonymy) to *Bauhinia (Phanera) rahmattii*, a designation disputed by Hou *et al.* (1996), who were unable to place the collection definitively.

Phanera maculata A. Rich. ex Teijsm. & Binn., *Cat. Hort. Bog.*: 268. 1866 “Bourbon”. *nomen. nud.*

Phanera ochroleuca Miq., *Fl. Ned. Ind.* 1(1): 69. 1855. Refers to a *Blume s.n.* collection (not seen), a possible variant of *Phanera glauca* possessing leaves that are slightly hairier below and bearing more numerous secondary veins than typical *P. glauca*.

Phanera parvifolia Teijsm. & Binn., *Cat. Hort. Bog.*: 268. 1866. “China”. *nomen. nud.*

De Wit (1956) notes that this name is represented by sterile herbarium specimens (in BO) which probably belong to *Bauhinia corymbosa* Roxb.

Phanera rosea A. Rich. ex Teijsm. & Binn., *Cat. Hort. Bog.*: 268. 1866. “Madagascar”. *nomen. nud.*
