*Author for correspondence

Abstract

Three new species of *Pitcairnia* from Mexico are proposed: *P. aleserratoae* was found in Guerrero, Morelos, and Puebla; *P. gracielae* known from the Estado de Mexico and Morelos while *P. pugana* has been collected in Jalisco. Information on distribution, habitat and phenology is provided for each species. The new taxa are compared with *P. jaliscana*, *P. karwinskyana*, *P. micheliana*, *P. palmeri*, and *P. pteropoda*, species morphologically similar.

Key words: endemic, Monocots, Sierra de Huautla, Sierra de Mazamitla

Resumen

Se proponen tres nuevas especies de *Pitcairnia* de México: *P. aleserratoae* localizada en Guerrero, Morelos y Puebla; *P. gracielae* conocida del Estado de México y Morelos; mientras que *P. pugana* se ha colectado en Jalisco. Para cada especie se proporciona información sobre la distribución, hábitat y fenología. Los nuevos taxa se comparan con *P. jaliscana*, *P. karwinskyana*, *P. micheliana*, *P. palmeri* y *P. pteropoda*, especies morfológicamente similares.

Palabras clave: endémicas, Monocotiledóneas, Sierra de Huautla, Sierra de Mazamitla

Introduction

Pitcairnia L'Hér. (1789: 5; 1790: t.11) including *Pepinia* Brongn. ex André (1870: 32, t.5) (Pereira Saraiva *et al.* 2015) is one of the genera with the highest number of species of the Bromeliaceae, ranking second after *Tillandsia* L. (1753: 286). Among the Pitcairnioideae, it is the richest and most widely distributed genus, including ca. 412 species (Pereira-Saraiva *et al.* 2015, Gouda *et al.* 2023 continuously updated), a number that continues to increase due to the recent discovery of new taxa (Espejo-Serna & López-Ferrari 2018, Flores-Argüelles *et al.* 2017, Beutelspacher & García-Martínez 2019, Mejía-Marín *et al.* 2020, Flores-Argüelles *et al.* 2022).

Pitcairnia species are distributed from Mexico to northern Argentina in South America, with *P. feliciana* (A. Chev.) Harms & Mildbraed (1938: 118), disjunct in West Africa (Smith & Till 1998, Porembski & Barthlott 1999, Benzing 2000). Most representatives of the genus are terrestrial or saxicolous plants, preferring shady places and humid or warm climates (Benzing 2000), although there are also epiphytic and even some subaquatic species (Smith & Till 1998, Espejo & López-Ferrari 2013).

In Mexico, 54 species are recorded of which 47 (87%) are endemic to the country (Espejo-Serna & López-Ferrari 2018, Beutelspacher & García-Martínez 2019, Mejía-Marín *et al.* 2020, Flores-Argüelles *et al.* 2022) and they grow preferably in tropical forests, coniferous forests, *Quercus* forests, cloud forests, and xerophilous scrubs (*sensu* Rzedowski 1978).

As part of the comprehensive review of herbarium specimens carried out during the doctoral project of the first author (González-Rocha 2023), several specimens of the genus that could not be assigned to any of the known species were detected. We proceeded to collect living and complete material in the populations from which they came and to carry out a detailed review of the protoglyphes and nomenclatural types of the morphologically similar taxa, which allowed us to confirm that these are novelties for the science that we propose here.

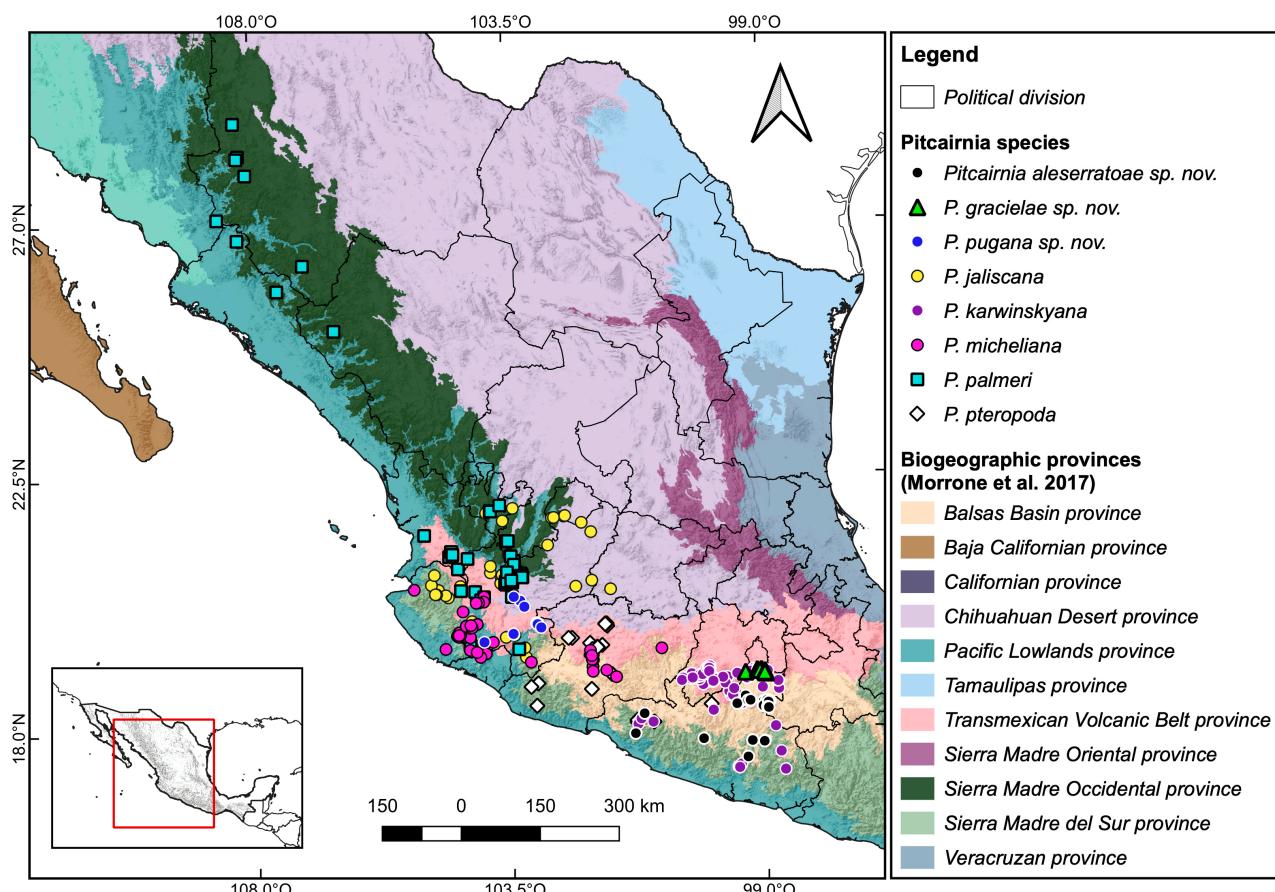

FIGURE 1. A) Combined distribution map for the species *Pitcairnia aleserratoae*, *P. gracielae*, *P. pugana*, *P. jaliscana*, *P. karwinskyana*, *P. micheliana*, *P. palmeri*, and *P. pteropoda*.

Material and methods

Plants were collected in 2012, 2013, 2015, and 2017 in populations of Sierra de Mazamitla, in the state of Jalisco and in Sierra de Tepoztlán and Sierra de Huautla, in the state of Morelos (Fig. 1). The gathering of the specimens was carried out in accordance with Lot and Chiang (1986). Measurements and descriptions were made from fresh material and herbarium specimens. The morphological terms used in the descriptions are those proposed by Radford *et al.* (1974) and Scharf and Gouda (2008). The holotypes were deposited at Herbario Metropolitano Ramón Riba y Nava Esparza, Universidad Autónoma Metropolitana Iztapalapa (UAMIZ) and the isotypes were deposited at Herbario Luz María Villarreal de Puga, Universidad de Guadalajara (IBUG) and Herbario Nacional, Universidad Nacional Autónoma de México (MEXU). We revised herbarium material of the genus *Pitcairnia* (approximately 1173 sheets) housed at BM, BR, CHAP, CHAPA, CIIDIR, CODAGEM, CORU, ENCB, FCME, G, GH, HUAA, HUMO, IBUG, IEB, INEGI, K, LL, MEXU, MICH, MO, NDG, NY, P, TEX, UAMIZ, UC, US, XAL, YU, and ZEA (acronyms according to Thiers 2021). To ensure the status of the proposed new species, we revised the protoglyphes, living specimens, herbarium specimens, and type material of the taxa with major morphological similarities: *Pitcairnia karwinskyana* Schult. &

Schult.f. (1830: 1239), *P. palmeri* S. Watson (1887: 456), *P. jaliscana* S. Watson (1887: 456), *P. micheliana* André (1901: 576, t. s.n.), *P. pteropoda* L.B. Sm. (1937: 26) and also images obtained from the JSTOR Global Plants database (JSTOR 2023 continuously updated) (Appendix 1) (Fig. 2). The distribution map of the species was elaborated with the open source geographic information system QGIS (2021), using the data obtained from the herbarium specimen labels and collected plants. In addition, data on the vegetation type (*sensu* Rzedowski 1978), in which the species grow, its distribution at the state level and by biogeographic provinces (*sensu* Morrone *et al.* 2017) (Fig. 1), elevation and phenology are included.

Taxonomy

Pitcairnia aleserratoae Gonz.-Rocha, López-Ferr. et Espejo, sp. nov. (Figs. 1, 3)

Type:—MEXICO, Morelos: municipality of Puente de Ixtla, 3.7 km sobre la brecha Tilzapota-El Salto, a partir de la carretera Tilzapotla-Coaxitlán, 18°28'0"N, 99°16'37"W, 1600 m, 10 November 2012, E. González-Rocha, A. Espejo & A.R. López-Ferrari 191 (holotype UAMIZ!, isotypes IBUG!, MEXU!).

Diagnosis:—*Pitcairnia aleserratoae* is similar to *P. micheliana* but differs in the size of the spikes (16–27 cm vs. 12.5–25 cm long), in the indument of the abaxial surface of the peduncle and the sepals (densely white-lepidote vs. sparsely white-lepidote), as well as the shape of the petals (ob lanceolate vs. narrowly elliptic to very narrowly oblong).

Description:—*Plant* saxicolous, cespitose, 22–55 cm high in flower. *Roots* fibrous. *Stem* bulbous, 2.6–4.8 cm long, 2.5–4.8 cm diameter; *stolons* present, terete, ca. 1 cm long, ca. 5 mm in diameter. *Leaves* not petiolate; *sheath* dark brown abaxially, light brown adaxially, widely depressed-ovate, 1.4–4.5 cm long, 1.3–3.5 cm wide, spiny-toothed on the margins distally; *leaf blades* of three different kinds: the first and main ones foliaceous, green, linear, 37–86 cm long, 6–11 mm wide, entire except the persisting base, conspicuously nerved, glabrous adaxially, densely white-lepidote abaxially, present during flowering season, deciduous by a transverse line of abscission well above the sheath, and the persistent portion densely white-lepidote on both sides and with retrorse spiny-teeth ca. 1.5 mm long on the margins; the second ones without blade and much reduced, sheath like, 6–9 cm long, 0.8–2 cm wide, lanceolate to narrowly triangular, entire, acuminate; the third ones non-photosynthetic, with a stiff persistent brown linear blade of 1.5–5 cm long, ca. 1.5 mm wide, densely white-lepidote on both sides, with retrorse spiny-teeth ca. 1.5 mm long on the margins. *Inflorescence* terminal, simple, spicate, erect; *peduncle* green, 11–31 cm long, 2.5–5.5 mm diameter, densely white-lepidote; *peduncle bracts* green, sometimes brownish towards the basal portion, ovate-lanceolate to lanceolate, 2.5–8.5 cm long, 6–16 mm wide, entire, glabrous adaxially, densely white-lepidote abaxially, decreasing in size distally; *the basal ones* acuminate, sometimes extending into a needle-like blade of 1–2 cm long, ca. 1 mm wide, with a spiny toothed margin, just exceeding the internodes; *the distal ones* exceeding the internodes; *spike* 16–27 cm long, with 19–34 flowers densely arranged along the rachis, polystichous; *rachis* densely white-lepidote, internodes up to 1.9 cm long; *floral bracts* reddish brown, triangular-ovate, 2.2–3.5 cm long, 8–15 mm wide, entire, narrowly sub-acuminate, glabrous adaxially, densely white-lepidote abaxially, imbricate, usually shorter than sepals, sometimes slightly longer specially in the basal ones, decreasing in size distally; *flowers* erect, appressed to ascendent to the rachis at anthesis, sessile, slightly zygomorphic; *sepals* pinkish red at the apex, greenish towards the base, lanceolate, 1.9–2.7 cm long, 4–5 mm wide, acuminate, glabrous adaxially, densely white-lepidote abaxially, the two adaxial ones carinate; *petals* red, oblanceolate, 4.6–6 cm long, 7–10 mm wide, rounded then broadly subacute, or occasionally slightly emarginate, turning to one side forming a cap over the stamens, short unguiculate, the claw 5–7 mm long, cream colored, without a nectary scale at the base; *stamens* 4.8–5.6 cm long, of about equal length, equal to or shorter than petals; *filaments* white, linear, 4–4.7 cm long; *anthers* yellow, linear, 8–10 mm long, basifixied; *pistil* exceeding the stamens; *ovary* 6–7 mm long, 2–4 mm diameter, ovoid; *style* linear, white, 5–5.3 cm long; *stigma* of the spiral conduplicate type, reddish. *Capsules* dark brown, ovoid, trigonous, 8–12 mm long, 3–6 mm diameter, rostrate; *seeds* light brown, fusiform, without appendages ca. 2 mm long, bicaudate, the caudae filiform, ca. 2 mm long.

Distribution, habitat and phenology:—The species is known from the biogeographic Balsas Basin and Sierra Madre del Sur provinces (Fig. 1), in the states of Guerrero, Morelos and Puebla, where it grows on rocky walls and humid slopes in *Quercus* and tropical deciduous forests, at elevations between 900 and 2000 m. The species flowers from September to December and bears mature fruits in December.

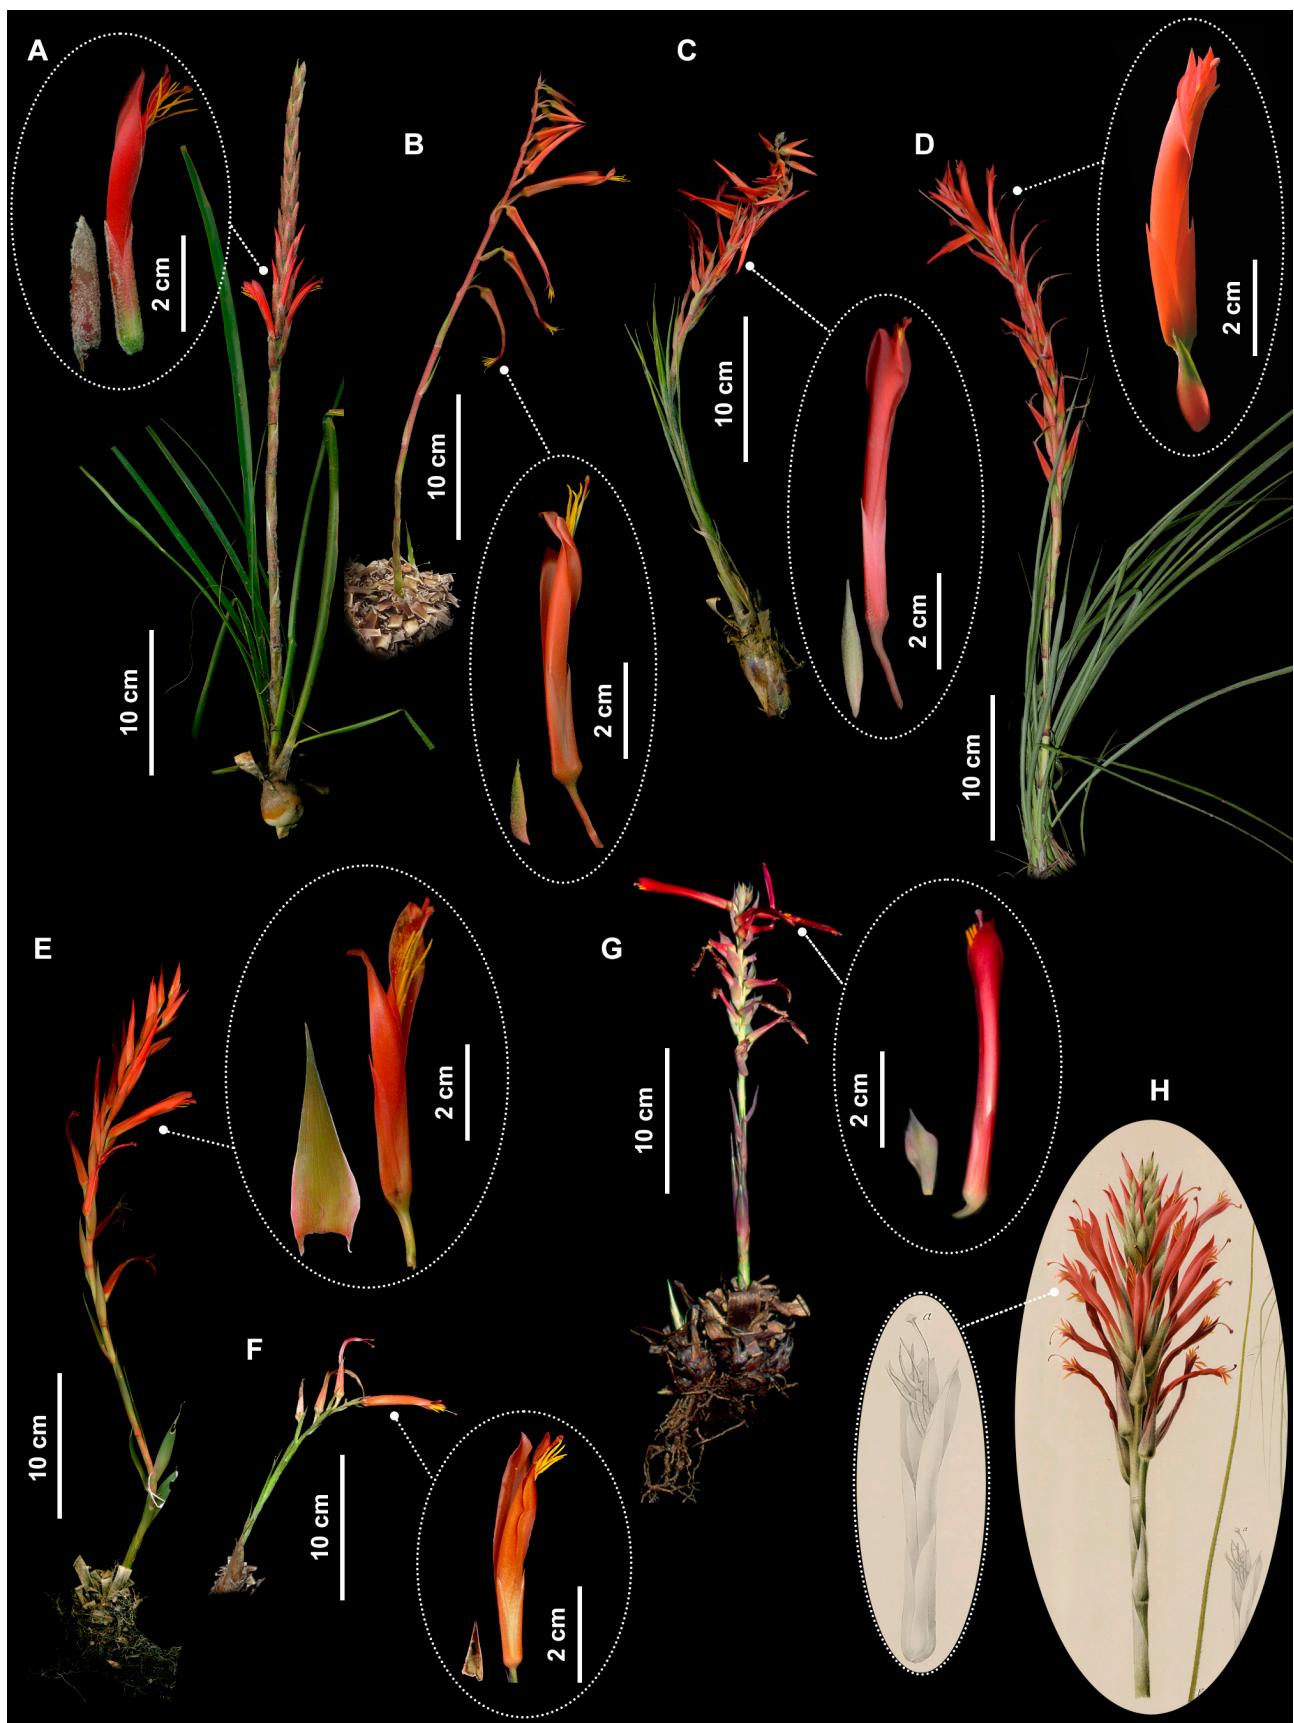

FIGURE 2. Comparison of plants and flowers of : A) *Pitcairnia aleserratoae*, B) *P. graciellae*, C) *P. pugana*, D) *P. jaliscana*, E) *P. karwinskyana*, F) *P. palmeri*, G) *P. pteropoda*, and H) type of *P. micheliana*. FIGURE 4. A) Dra. Alejandra Serrato Díaz (1972–2021), B) Dra. Graciela Calderón Díaz Barriga (1931–2022), and C) Professor Luz María Villarreal de Puga (1913–2013). Photos: Yanin Islas Barrios (A), Sergio Zamudio Ruiz (B), and Luz María González Villarreal (C).

Etymology:—The specific epithet honors Dra. Alejandra Serrato Díaz (1972–2021) (Fig. 4A), professor who was in charge of Divisional Laboratory of Molecular Biology at the Universidad Autónoma Metropolitana-Iztapalapa. She always supported her students and contributed notably to the first author's doctoral project, allowing that it was developed and concluded successfully.

Comments:—The new species had previously been identified by several authors as *Pitcairnia roseana* L.B. Sm. (1937: 27) (Pulido-Esparza *et al.* 2004, Espejo-Serna & López-Ferrari 2010, González-Rocha *et al.* 2016). However, upon analyzing in detail and comparing the specimens of both taxa, we were able to notice that in the plants of *P. roseana*, distributed in northwestern Mexico (Durango, Jalisco and Nayarit), all the bracts of the peduncle are long foliaceous and equaling or exceeding the peduncle, while in *P. aleserratoae* all the bracts of the peduncle are bractiform and much shorter, and just exceeding the internodes, and the species restricts its distribution to the central-southern region of the country (Guerrero, Morelos and Puebla).

Pitcairnia aleserratoae is rather similar to *P. micheliana*; both have inflorescences in spike narrowly cylindrical with sessile flowers, and their phenology is also similar, they flower when photosynthetic leaves are present. However, the two species differ in the size of their inflorescences and in the indument of leaves, as well as in their distribution.

The nomenclatural type of *Pitcairnia micheliana*, was prepared from cultivated plants obtained from seeds collected by Eugène Langlasse in Ingurán, Michoacán. Smith and Downs (1974) mentioned that the figure included in the original description could be considered as the type. Herbarium specimens from sites close to the type locality are scarce in institutional collections (Michoacán: La Huacana, Santa Mónica, Sierra de Ingurán, A.R. López-Ferrari *et al.* 2057, UAMIZ!), and it has been extremely complicated to collect additional material due to the current situation of insecurity in that area. We have decided to consider *P. micheliana* as a valid species, including under this name all the specimens from Michoacán, Jalisco, and Colima that match with the original description and the figure that accompanies it, until we have living material to carry out a more complete analysis.

Examined specimens (paratypes):—GUERRERO. **Buenavista de Cuéllar.** Al S de El Salto, del lado del estado de Guerrero, 14 km al SW de Tilzapotla, S. Morales S. 71 (FCME). **Iguala de la Independencia.** Cañón de la Mano, entre los Amates y El Naranjo, 10 km al N de Iguala por el ferrocarril, C. Catalán H. 249 (CHAPA), C. Catalán H. 295 (CHAPA); C. Catalán H. 318 (CHAPA), C. Catalán H., F. Terán & S. Vázquez 371 (CHAPA), C. ***Pitcairnia gracielae* Gonz.-Rocha, López-Ferr. et Espejo, sp. nov. (Figs. 1, 5)**

Type:—MEXICO, Morelos: municipality of Tepoztlán, sendero a la zona arqueológica del Tepozteco 18°59'50.5"N, 99°05'58.4"W, 1890 m, 16 April 2016, E. González-Rocha & F. Bonilla 383 (holotype UAMIZ!; isotypes IBUG!, MEXU!).

Diagnosis:—*Pitcairnia gracielae* is similar to *P. palmeri* but differs in the indument of the photosynthetic leaves (sparsely white-lepidote on the margins *vs.* sparsely white-lepidote on abaxial surface), in the shape and size of the floral bracts (ovate, 4–11 mm wide *vs.* narrowly triangular, 2–5 mm wide), and in the orientation of the flowers at anthesis (secondly spreading to nutant *vs.* erect to ascending).

Description:—Plant saxicolous, cespitose, 21–48 cm high in flower. Roots fibrous. Stem bulbous, 4–9 cm long, 3–7 cm diameter; stolons present, terete, 2–3 cm long, 4–5 mm diameter. Leaves not petiolate; sheath dark brown abaxially, light brown adaxially, oblong, 2.5–4 cm long, 1.8–3 cm wide, entire; leaf blades of three different kinds:

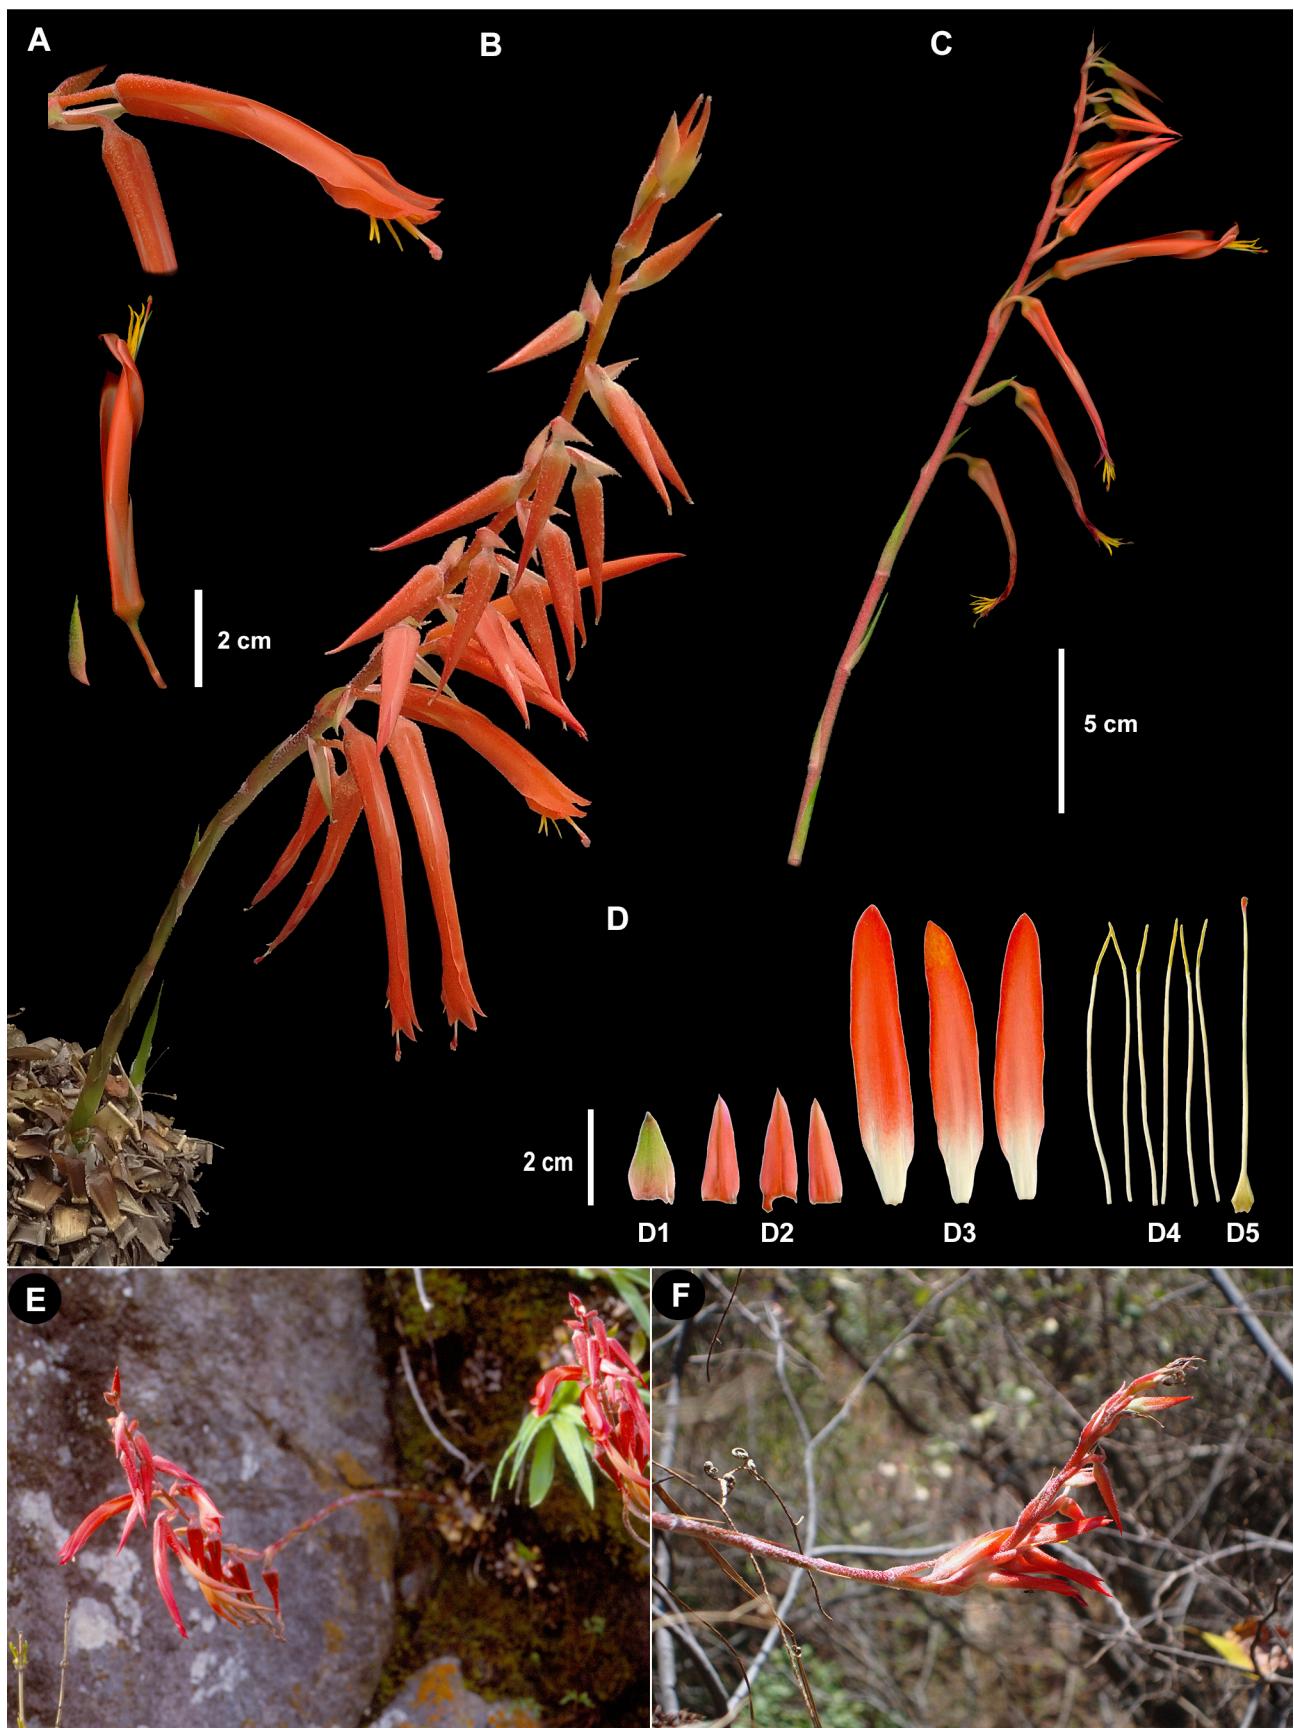

FIGURE 5. *Pitcairnia gracielae*, A) flowers and floral bract, lateral view, B) flowering plant, A. Espejo 7400 (UAMIZ!), C) inflorescence, E. González-Rocha et al. 234 (UAMIZ!), D) dissected flower: D1 floral bract, D2 sepals, D3 petals, D4 stamens, D5 pistil, E. González-Rocha 91 (UAMIZ!), E) flowering plant in habitat, A. Espejo 6089 (UAMIZ!), F) inflorescence in habitat, E. González-Rocha 113 (UAMIZ!). Photos: A. Espejo (A, B, E), and E. González-Rocha (C, D, F).

the first and main ones foliaceous, green, linear, 20–40 cm long, 6–10 mm wide, entire, except the persisting base, conspicuously nerved, glabrous on both surfaces except the white-lepidote margins on both sides, not present during flowering season, deciduous by a transverse line of abscission well above the sheath and the persistent portion densely white-lepidote adaxially, sparsely white-lepidote abaxially and with retrorse spiny-teeth ca. 1 mm long on the margins; the second ones reduced and sheath like, papiraceous, 2–6 cm long, 1–1.5 cm wide, lanceolate to narrowly triangular, entire, acuminate, conspicuously nerved, sparsely lepidote adaxially, densely to sparsely white lepidote abaxially; the third ones non-photosynthetic, with a stiff persistent brown linear blade, of 1–8 cm long, ca. 1 mm wide, densely white-lepidote on both sides, with retrorse spiny-teeth of ca. 1 mm long on the margins. *Inflorescence* racemose, often slightly curved; *peduncle* brownish to reddish distally, 13–34 cm long, 2–3 mm diameter, sparsely to densely white-lepidote at the nodes, for most part visible; *peduncle bracts* green, narrowly triangular to ovate-lanceolate, 1.6–11 cm long, 4–12 mm wide, entire, glabrous adaxially, sparsely white-lepidote to glabrescent abaxially, decreasing in size distally; *the basal ones* long-acuminate, just exceeding the internodes; *the distal ones* slightly longer than internodes, sometimes shorter; *raceme* 7–17 cm long, with 9–24 flowers loosely arranged along the rachis, secund; *rachis* nearly fully exposed, sparsely white-lepidote, internodes up to 2.3 cm long; *floral bracts* pale green or tinged reddish, narrowly ovate, 1.3–2.6 cm long, 4–11 mm wide, entire, acuminate, glabrous adaxially, sparsely white-lepidote abaxially, decreasing in size distally, usually shorter than the pedicels or slightly longer; *flowers* secund, spreading to nutant at anthesis or shortly afterward, slightly zygomorphic, pedicellate; *pedicel* slender, divergent to curving at age, 4–23 mm long, sparsely white-lepidote; *sepals* reddish, lanceolate, 2–2.7 cm long, 5–7 mm wide, acuminate, glabrous adaxially, sparsely white-lepidote abaxially, the two adaxial ones carinate; *petals* red to orange-red, very narrowly oblong, 5.3–6.1 cm long, 8–12 mm wide, rounded then obtuse or broadly acutish, turning to one side forming a cap over the stamens, short unguiculate, the claw 5–7 mm long, whitish, without a nectary scale at the base; *stamens* 5.2–6 cm long, shorter than the petals; *filaments* white, linear, 4.3–5 cm long; *anthers* yellow, linear, 8–10 mm long, basifixied. *Capsules* dark brown, ovoid, trigonous, 14–15 mm long, 5–6 mm diameter, rostrate; *seeds* reddish brown, fusiform, without appendages 1.5–2 mm long, bicaudate, the caudae filiform, ca. 1 mm long.

Distribution, habitat and phenology:—*P. gracielae* is endemic to the biogeographic Transmexican Volcanic Belt province, in the states of Morelos and Estado de México (Fig. 1), where it grows on rocky walls in coniferous and *Quercus* forests, in relicts of cloud forests, and in tropical deciduous forests, at elevations between 1700 and 2500 m. The species flowers during March to June.

Etymology:—The specific epithet honors Dra. Graciela Calderón Díaz Barriga (1931–2022), professor and eminent botanist specialised in various families of angiosperms, whose dedication and constant work contributed significantly to the knowledge of Mexican Flora (Fig. 4B).

Comments:—Material of this new taxon had been erroneously identified in herbarium specimens as *Pitcairnia palmeri* var. *longebracteata* (1960: 64) by L.B. Sm. in 1974 due to the presence of long pedicellated secund flowers and floral bracts slightly longer than the pedicels; in Flora Neotropica, Smith & Downs (1974) included some specimen of this species in the section of examined specimens for *P. palmeri* var. *longebracteta*, collections from Chihuahua (*H. Leseur* 1258, GH!; *Pennington* 113, US!), Michoacán (*R.M. King* & *T.S. Soderstrom* 4846, US!), Morelos (*C.G. Pringle* 9181, GH!, US!; *O. Nagel* 8092, GH!), and Nayarit (*R. McVaugh* 16496, MICH!, US!), which have been subsequently revised and identified (McVaugh, 1989) with other names: *P. palmeri* (*H. Leseur* 1258; *Pennington* 113), *P. pteropoda* (*R.M. King* & *T.S. Soderstrom* 4846), and *P. compostelae* McVaugh (1989: 27) (*R. McVaugh* 16496). However, based on the results of a multivariate analysis González-Rocha *et al.* (2018), concluded that the specimens assigned to *P. palmeri* var. *longebracteta* actually correspond to a different species for which they proposed the name *P. robert-downsii* Gonz.-Rocha, Espejo, López-Ferr. & Cast.-Riv (2018: 224). Although the material from Morelos that these authors included in their analysis was grouped with *P. palmeri*. A detailed comparison of these specimens with the type material of this species, allowed us to observe differences in some characteristics as the indument on the main green leaves, the size of the peduncle, and in the shape and size of the floral bracts. Furthermore, in living plants of *P. palmeri* the flowers are always secund but then ascending, while in *P. gracielae* these are secund spreading to soon nutant.

***Pitcairnia pugana* Gonz.-Rocha et P. Carrillo, sp. nov. (Figs. 1, 6)**

Type:—MEXICO, Jalisco: municipality of Mazamitla, cascada Los Cazos, 3.5 km aprox. al SW de Mazamitla, sierra del Tigre, 19°53'35.9"N, 103°02'29.8"W, bosque de *Quercus* alterado, 2100 m, 14 June 2017, *E. González-Rocha & P. Carrillo-Reyes* 403 (holotype UAMIZ!, isotypes IBUG!, MEXU!).

Diagnosis:—*Pitcairnia pugana* is similar to *P. jaliscana* but differs in the inflorescence direction (curved vs. erect), in the size and indument of the peduncle (16–25 cm long, densely white-lepidote vs. 12–40 cm long, sparsely white-lepidote to glabrescent) and in the size of the peduncle bracts (12–29 cm long, barely surpassing the peduncle vs. 12–57 cm long, much longer than the peduncle).

Description:—*Plant* saxicolous, cespitose, 23–54 cm high in flower. *Roots* fibrous. *Stem* bulbous, 3–5.5 cm long, 2–4 cm diameter. *Leaves* not petiolate; *sheath* brown abaxially, light brown adaxially, widely ovate to ovate, 2–4.3 cm long, 1.3–3 cm wide, entire; *leaf blades* of three different kinds: the first and main ones foliaceous, green, linear, 21–40 cm long, 6–10 mm wide, entire except on the persisting base, conspicuously nerved, glabrous adaxially, densely white-lepidote abaxially, not present during flowering season, deciduous by a transverse line of abscission well above the sheath and the persistent portion densely white-lepidote adaxially, sparsely white-lepidote abaxially and with antrorse spiny-teeth ca. 1 mm long on the margins; the second ones reduced and sheath like, papiraceous, 5–6 cm long, 1–1.5 cm wide, lanceolate to narrowly oblong, entire, acuminate, conspicuously nerved, sparsely lepidote adaxially, white lepidote abaxially; the third ones non-photosynthetic, with a stiff persistent brown linear blade, 1.5–4.5 cm long, ca. 1 mm wide, glabrous adaxially, densely white-lepidote abaxially, with retrorse spiny-teeth ca. 1 mm long on the margins. *Inflorescence* racemose, curved; *peduncle* red, 16–25 cm long, 1.5–4 mm diameter, densely white-lepidote, totally covered by the peduncle bracts in the basal portion, partly visible in distal portion; *peduncle bracts* green, lanceolate, entire, acuminate, glabrous adaxially, densely white-lepidote abaxially, *the basal ones* foliaceous, 12–29 cm long, 8–11 mm wide, much exceeding the internodes, almost as long as the peduncle; *the distal ones* green, 2–4.2 cm long, 6–8 mm wide, longer than internodes, nearly completely covering the peduncle; *raceme* 7–22 cm long, with 10–27 flowers loosely to subdensely and polystichous arranged along the rachis, internodes up to 1.8 cm long; *rachis* visible, densely to sparsely white-lepidote, green to reddish; *floral bracts* green with reddish tones towards the base, ovate-lanceolate, 1.5–3.5 cm long, 6–10 mm wide, entire, acuminate, glabrous adaxially, densely white-lepidote abaxially, longer than pedicels, never surpassing the sepals, decreasing in size distally; *flowers* erect to divaricate at anthesis, slightly zygomorphic, pedicellate; *pedicels* slender, erect to divaricate, 3–23 mm long, white-lepidote; *sepals* red, narrowly triangular-ovate, 2–2.7 cm long, 5–7 mm wide, acuminate, glabrous adaxially, sparsely white-lepidote abaxially especially on the keel, the two adaxial ones carinate; *petals* red, very narrowly oblong, 5.4–6.2 cm long, 6–12 mm wide, rounded then obtuse, turning to one side forming a cap over the stamens, short unguiculate, the claw 4–6 mm long, white, without a nectary scale at the base; *stamens* 4.8–5.9 cm long, shorter than petals; *filaments* white, linear, 4–5 cm long; *anthers* yellow, linear, 7–9 mm long, basifixied; *ovary* 7–8 mm long, 3–4 mm diameter, ovoid; *style* 4.5–5.6 cm long. *Capsules* light brown, ovoid, trigonous, 13–15 mm long, ca. 5 mm diameter, rostrate; *seeds* reddish brown, fusiform, without appendages ca. 2 mm long, bicaudate, the caudae filiform, ca. 0.5 mm long.

Habitat, distribution and phenology:—*Pitcairnia pugana* is known so far only from the state of Jalisco, in the biogeographic Transmexican Volcanic Belt, Sierra Madre del Sur and Chihuahuan Desert provinces (Fig. 1); it grows on rock walls, near streams, in coniferous forests and *Quercus* forests with elements of tropical deciduous forest, at elevations between 1200 and 2200 m. The species flowers during May to June and has immature fruits in August and September.

Etymology:—The species honors Luz María Villarreal de Puga (1913–2013) (Fig. 4C), an outstanding professor and dedicated botanist who carried out extraordinary work as a teacher and educator, and promoted studies on the flora and vegetation in the state of Jalisco for many years, and contributed noticeably in expanding the herbarium of Instituto de Botánica de la Universidad de Guadalajara (IBUG).

TABLE 1. Morphological differences between *Pitcairnia alesseratoae*, *P. gracielae*, *P. pugana*, *P. jaliscana*, *P. karwinskyana*, *P. micheliana*, *P. palmeri*, and *P. pieropoda*.

Characters	<i>Pitcairnia alesseratoae</i>	<i>Pitcairnia gracielae</i>	<i>Pitcairnia pugana</i>	<i>Pitcairnia jaliscana</i>	<i>Pitcairnia karwinskyana</i>	<i>Pitcairnia micheliana</i>	<i>Pitcairnia palmeri</i>	<i>Pitcairnia pieropoda</i>
Plant length in flower	22–55 cm	21–48 cm	23–54 cm	20–80 cm	25–53 cm	27–56 cm	7–39 cm	20–52 cm
Indument on the main green leaves	glabrous adaxially, densely white-lepidote abaxially	glabrous on both surfaces, except the white-lepidote margins	glabrous adaxially, densely white-lepidote abaxially	glabrous on both surfaces, except the sparsely white-lepidote margins	glabrous adaxially, densely white-lepidote abaxially	glabrous adaxially, sparsely white-lepidote abaxially	glabrous on both surfaces, except the sparsely white-lepidote margins	glabrous adaxially, sparsely white-lepidote abaxially
Presence/absence of the main leaves during the flowering season	present	missing	missing	missing	missing	present	missing	missing
Inflorescence type and orientation	spike, erect	raceme, curved	raceme, curved	raceme, erect	raceme, erect	raceme, erect	raceme, curved	raceme, erect
Peduncle length, and indument	11–31 cm, densely white-lepidote	13–34 cm, sparsely to densely white-lepidote at the internodes	16–25 cm, densely white-lepidote	12–40 cm, sparsely white-lepidote	9–31 cm, sparsely white-lepidote to glabrescent	16–28 cm, sparsely white-lepidote	3–24 cm, densely to sparsely white-lepidote	10–31 cm, glabrescent to glabrous
Basal peduncle bracts	6–8.5 × 0.9–1.6 cm, ovate-lanceolate	4–11 × 0.8–1.2 cm, narrowly triangular	12–29 × 0.8–1.1 cm, linear	12–44–(57) × 0.5–1 cm, linear	4–40 × 1–1.2 cm, linear to lanceolate	5.5–10 × 0.8–1.3 cm, lanceolate	2–9 × 0.3–0.8 cm, lanceolate	3.5–12–(24) × 0.6–1.7 cm, linear-lanceolate
Inflorescence fertile part length	16–27 cm	7–17 cm	7–22 cm	8–40 cm	10–29 cm	12.5–25 cm	2–24 cm	7–26 cm
Arrangement of flowers on the rachis of inflorescence during anthesis	not secund and densely arranged	secund and loosely arranged	not secund and loosely arranged	not secund and loosely arranged	not secund and loosely arranged	not secund and more or less densely arranged	secund and loosely arranged	not secund and loosely disposed
Flowers per inflorescence	19–34	9–24	10–27	7–43	10–30	18–45	3–24	6–52
Floral bracts	22–35 × 8–15 mm, triangular-ovate	13–26 × 4–11 mm, ovate	15–35 × 6–10 mm, ovate-lanceolate	20–50 × 6–14 mm, very widely ovate	22–67 × 10–22 mm, narrowly triangular-ovate	17–33 × 5–7 mm, triangular	10–28 × 2–5 mm, narrowly triangular ovate	16–28 × 8–13 mm,
Position of flowers during anthesis	ascending to appressed	spreading to nutant	erect to divaricate	ascending	ascending	ascending to appressed	erect to ascending	ascending to divaricate
Sepals size	19–27 × 4–5 mm	20–27 × 3–7 mm	20–27 × 5–7 mm	17–30 × 3–6 mm	20–36 × 3–7 mm	23–25 × 3–5 mm	14–25 × 3–4 mm	15–24 × 4–6 mm
Petals	46–60 × 7–10 mm, oblanceolate	53–61 × 8–12 mm, very narrowly oblong	54–62 × 6–12 mm, very narrowly oblong	50–62 × 6–9 mm, very narrowly oblong to very narrowly elliptic	45–65 × 9–12 mm, very narrowly elliptic to very narrowly oblong	50–56 × 6–8 mm, narrowly elliptic to very narrowly oblong	37–56 × 6–9 mm, lanceolate	51–53 × 7–9 mm, very narrowly oblong
Distribution	Guerrero, Morelos, and Puebla	Morelos, and Estado de México	Jalisco	Aguascalientes, Guanajuato, Jalisco, and Zacatecas	Guerrero, Estado de México, and Morelos	Colima, Jalisco, and Michoacán	Chihuahua, Durango, Jalisco, Nayarit, Sinaloa, and Zacatecas	Guerrero, and Michoacán
Flowering time	September–December	March–June	May–June	July–October	May–August	September–December	May–August	June–August

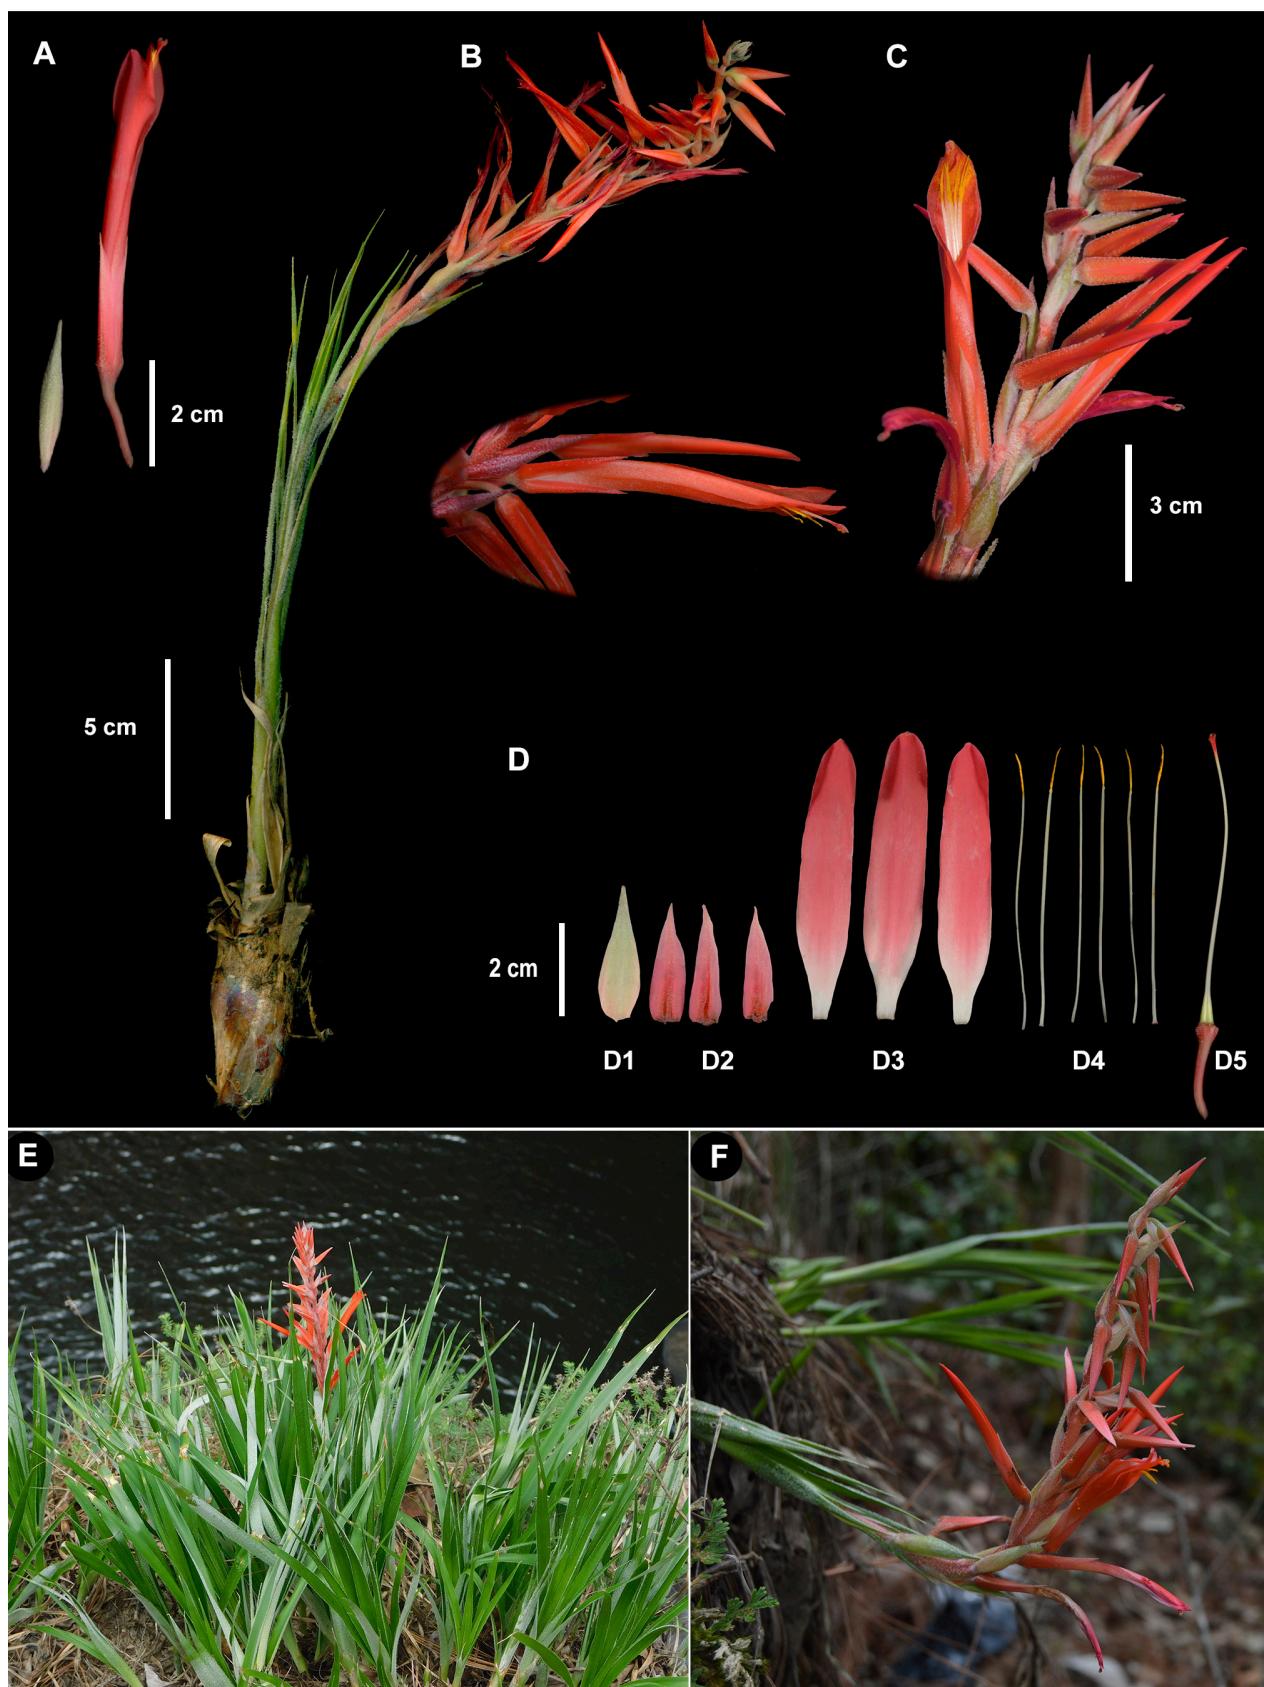

FIGURE 6. *Pitcairnia pugana*, A) floral bract and flower, lateral view, B) flowering plant, C) inflorescence and flowers detail, D) dissected flower: D1 floral bract, D2 sepals, D3 petals, D4 stamens, D5 pistil and flower base, E) plant flowering in habitat, F) inflorescence in habitat, E. González-Rocha & P. Carrillo-Reyes 403, 404 (UAMIZ!). Photos: E. González-Rocha (A, B, D, F), and P. Carrillo-Reyes (C, E).

Comments:—Specimens of the new species had previously been identified as *P. karwinskyana*, *P. pteropoda* and/or *P. jaliscana*. However, the detailed analysis of the material allowed us to conclude that it was novelty. The new species here proposed, which is distinguished by the presence of a dense and white indument that covers almost all vegetative and floral structures, a character not present in any of the afore mentioned species (see Table 1).

Examined specimens (paratypes):—JALISCO. **Chapala.** Sin localidad, *E.W.D. Holway No. A* (GH). **Jocotepec.** San Juan Cosalá, serranía Tecuán, *L.M. Villarreal de Puga 440* (ENCB); Sierra del Tecuán, San Juan Cosalá, *L.M. Villarreal de Puga 3203* (IBUG). **Mazamitla.** Jardín Encantado, ca de 2.5 km al SW de Mazamitla, *E. González-Rocha & P. Carrillo-Reyes 404* (UAMIZ); a 4 km al sur de Mazamitla, *R. Hernández M. 406* (MEXU); sierra del Tigre, 3 miles south of Mazamitla, *R. Ramírez S. & H. Arreola 2051* (IBUG). **Zapotlán el Grande.** Barrancas near Zapotlán, *C.G. Pringle 5372* (MEXU).

Acknowledgments

The authors thank to Dr. Sergio Zamudio Ruiz, Dra. Rosa Cerros Tlatilpa, M. en C. Fernando Bonilla Badía, M. en C. Julián Hernández Rendón, and M. en B. Lizeth Jimena Hernández Barón, for their support in the field work. To Sergio Zamudio Ruiz, Yanin Islas Barrios, and Luz María González Villarreal for kindly share with us pictures of the praised women. To the curators and staff of the herbaria consulted for the facilities granted for unrestricted acces to their collections. Additionally, we thank to Eric J. Gouda and one anonymous reviewer for their comments and suggestions that improved the final manuscript. This study was partially supported by the Consejo Nacional de Humanidades, Ciencias y Tecnologías through the scholarship (265753) of the first autor during her studies in the Doctorate Program in Ciencias Biológicas y de la Salud, Universidad Autónoma Metropolitana.
